does a pattern emerge?

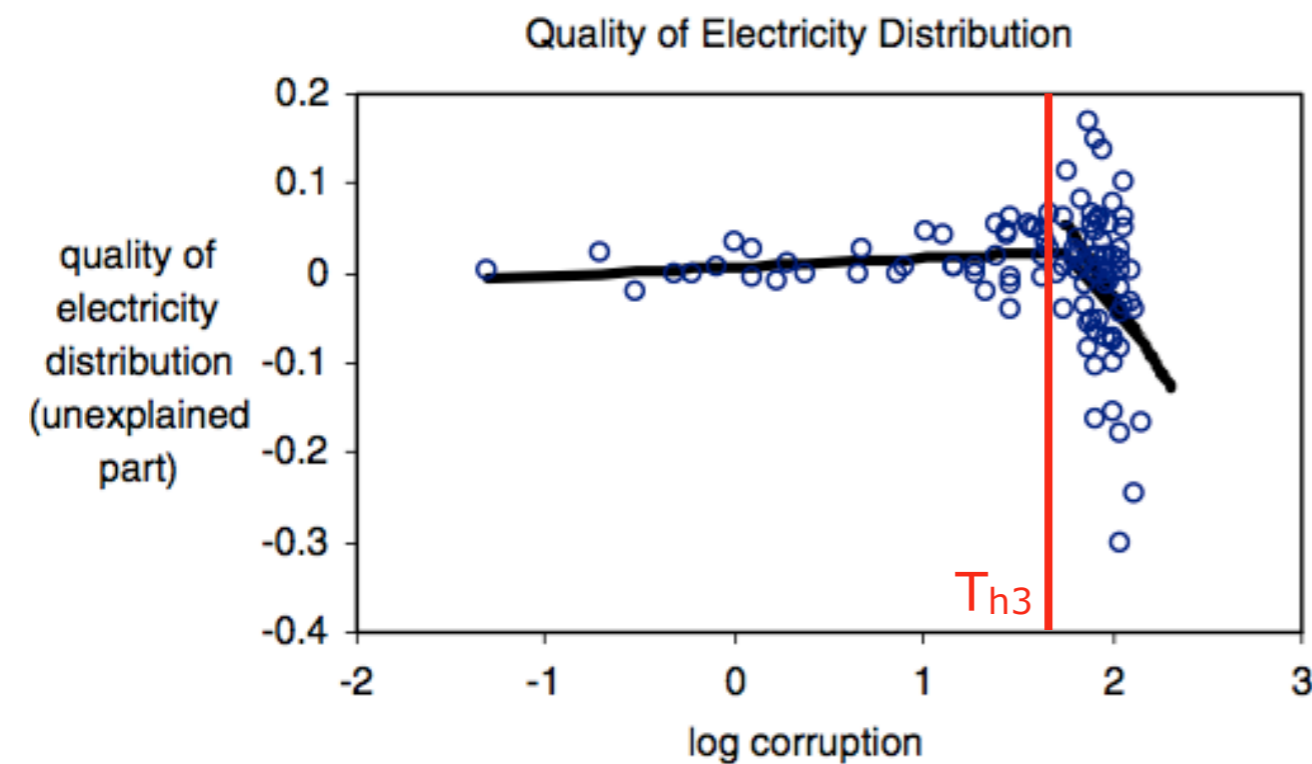

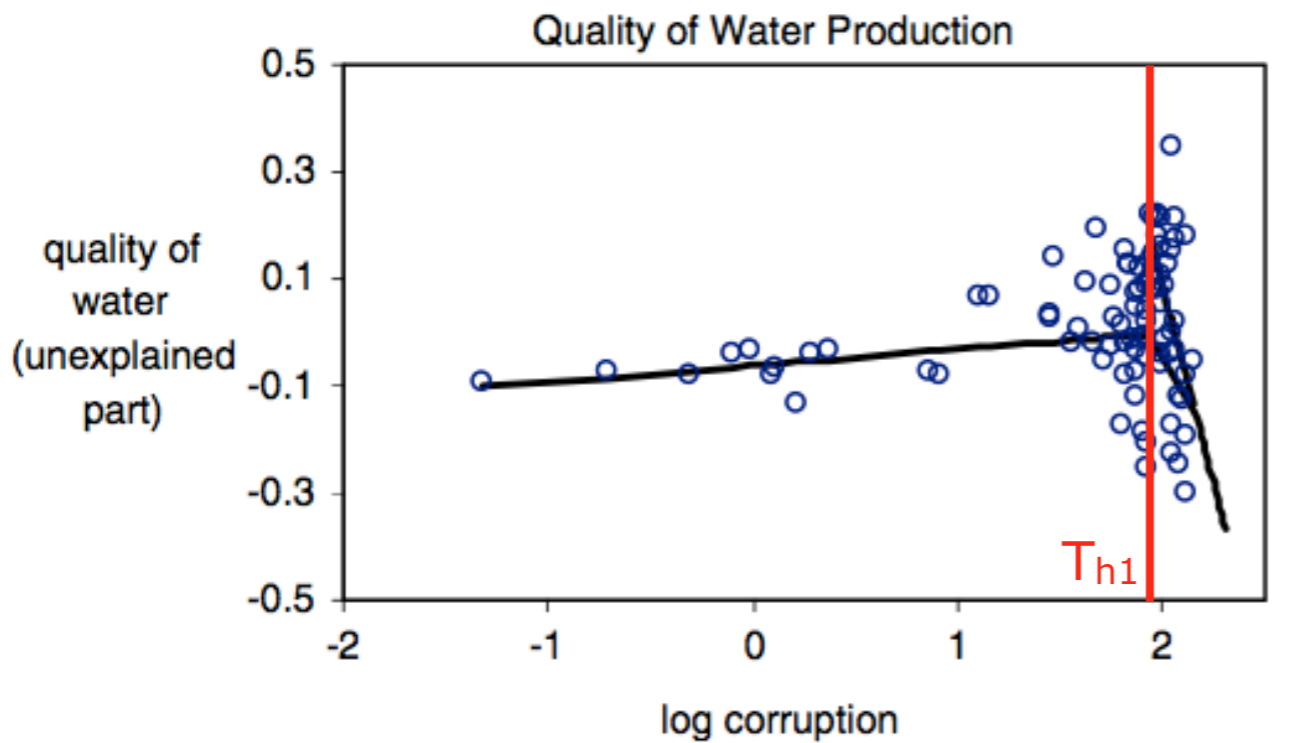

Patterns of corruption

Patterns of corruption

Threshold Effects of Corruption

N. Bose et al., Threshold Effects of Corruption: Theory and Evidence. World Development, 36 (7), 2008.

Key questions

- Can capturing patterns help us:
 - understand **corrupt norms? T_h value?**
 - design specific anti-corruption policies?
- **Limitations** of analytic approaches?
 - human incentives
(bounded + unbounded rational players)
 - social networks
(contact + financial networks)
- Agent-based modeling as public policy simulators?

Focus

- Micro motives (**local mechanisms**) that leads to macro phenomenon (**e.g., threshold effect**)
- Model the **structure** and **dynamic processes** on networks

Patterns of corruption

Outline

- Social networks
 - generation of patterns of corruption
 - hypothetical generation mechanism
- Advantages + disadvantages
- Your opinion / suggestion?

Complex social networks

Which vertex would proof
most crucial?

Which vertex would proof
most crucial?

statistical properties!!

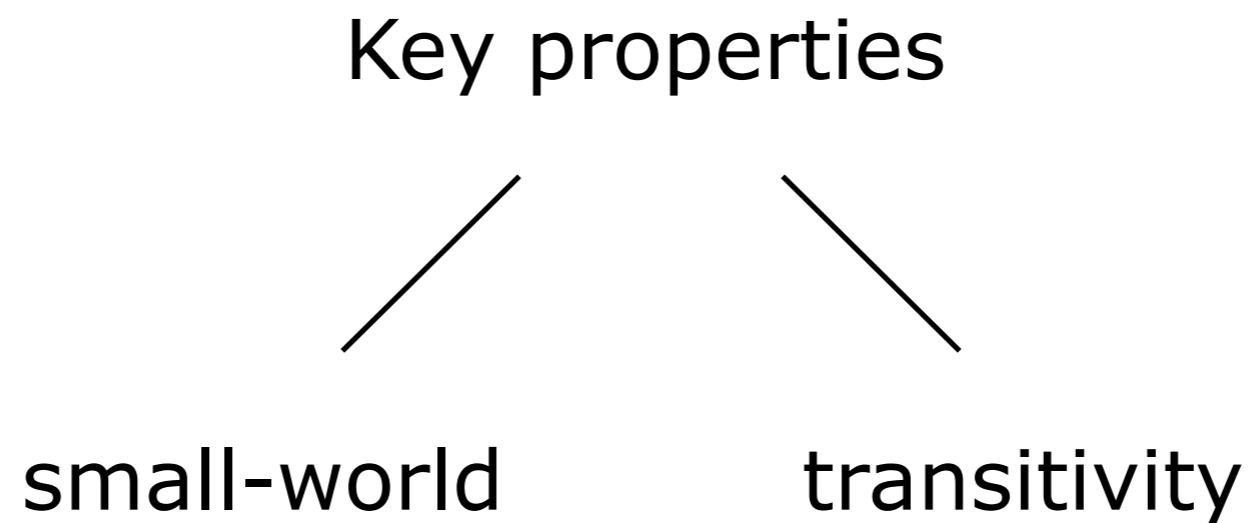

Structure

Social networks are **not random!**

1. Possible mechanisms **guiding network formation**
2. Ways to **exploit structure** to achieve certain aims

Social networks are **not random!**

1. Possible mechanisms **guiding network formation**
2. Ways to **exploit structure** to achieve certain aims

Small-word

**Stanley Milgram. "The Small World Problem".
Psychology Today, May 1967.**

The basic experiment:

- The name of the target person + certain information (orient the participants towards specific individuals)
- If you do not know the target person on a first-hand basis, do not try to contact him directly
- A roster on which each person in the chain writes his name (prevent endless looping)

The Small-World

By Stanley Milgram

Almost all of us have had the experience of encountering someone far from home, who, to our surprise, turns out to share a mutual acquaintance with us. This kind of experience occurs with sufficient frequency so that our language even provides a cliché to be uttered at the appropriate moment of recognizing mutual acquaintances.

We say, "My it's a small world."

The chains progress from the starting position (Omaha) to the target area (Boston) with each remove. Diagram shows the number of miles from the target area, with the distance of each remove averaged over completed and uncompleted chains.

$$l = \frac{1}{\frac{1}{2}n(n+1)} \sum_{i \geq j} d_{ij}$$

Stanley Milgram, The small world problem. Phycology today, 1967

Transitivity or clustering

“A friend of a friend
is also my friend”

Strogatz-Watts

Regular

Small-world

Random

$p = 0$

$p = 1$

Increasing randomness

high cluster
large path length

low cluster
small path length

Strogatz-Watts

Regular

$p = 0$

high cluster
large path length

Small-world

highly clustered like a regular graph, yet with small characteristic path length

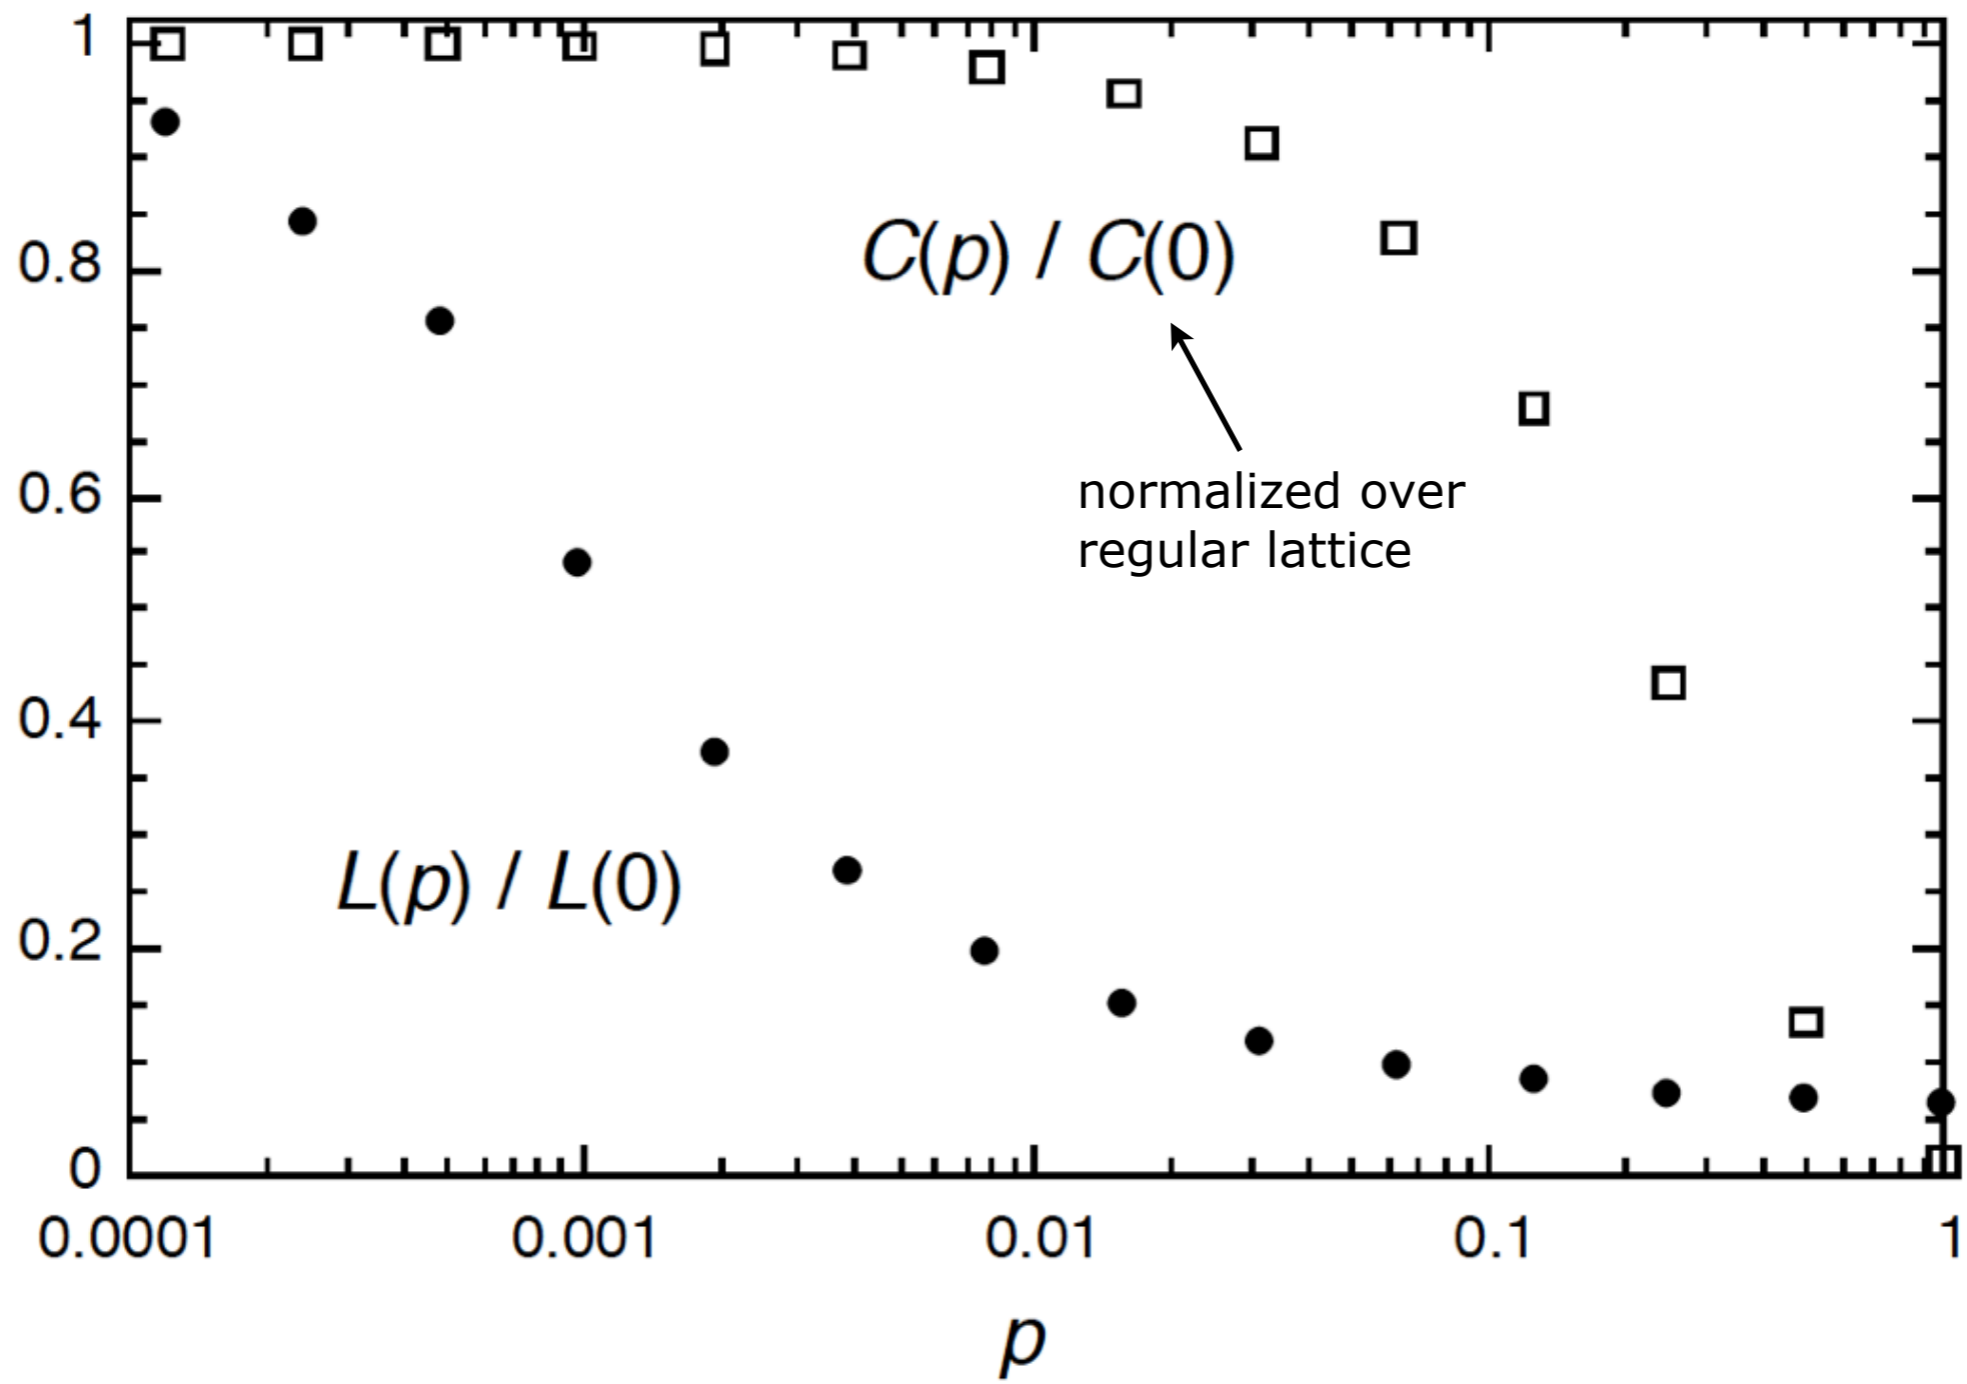

Increasing randomness

Random

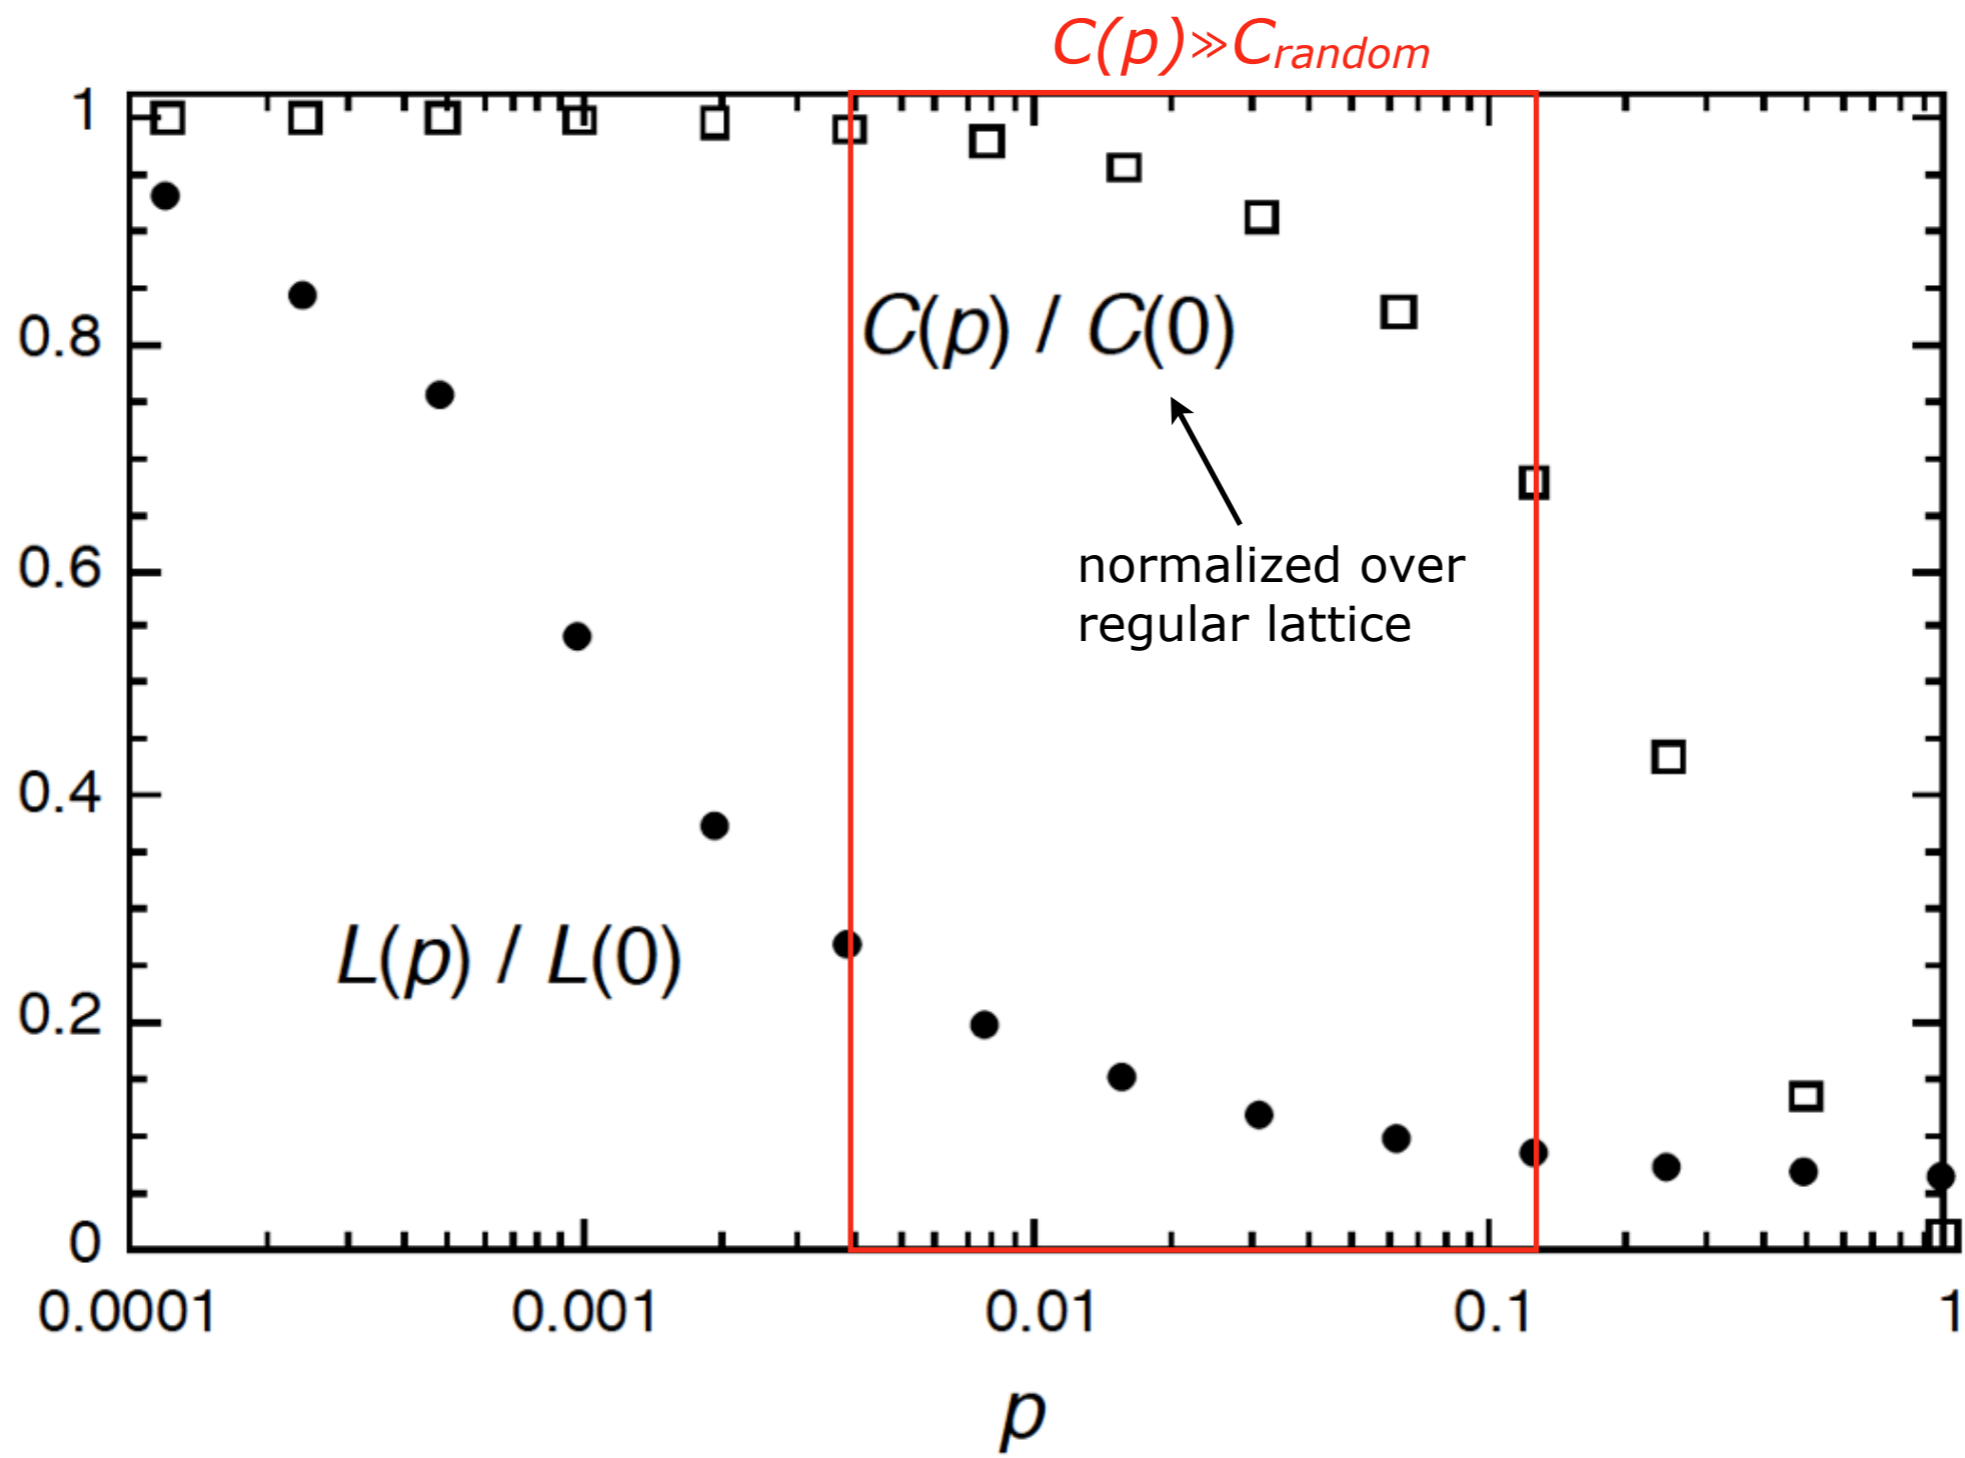

$p = 1$

low cluster
small path length

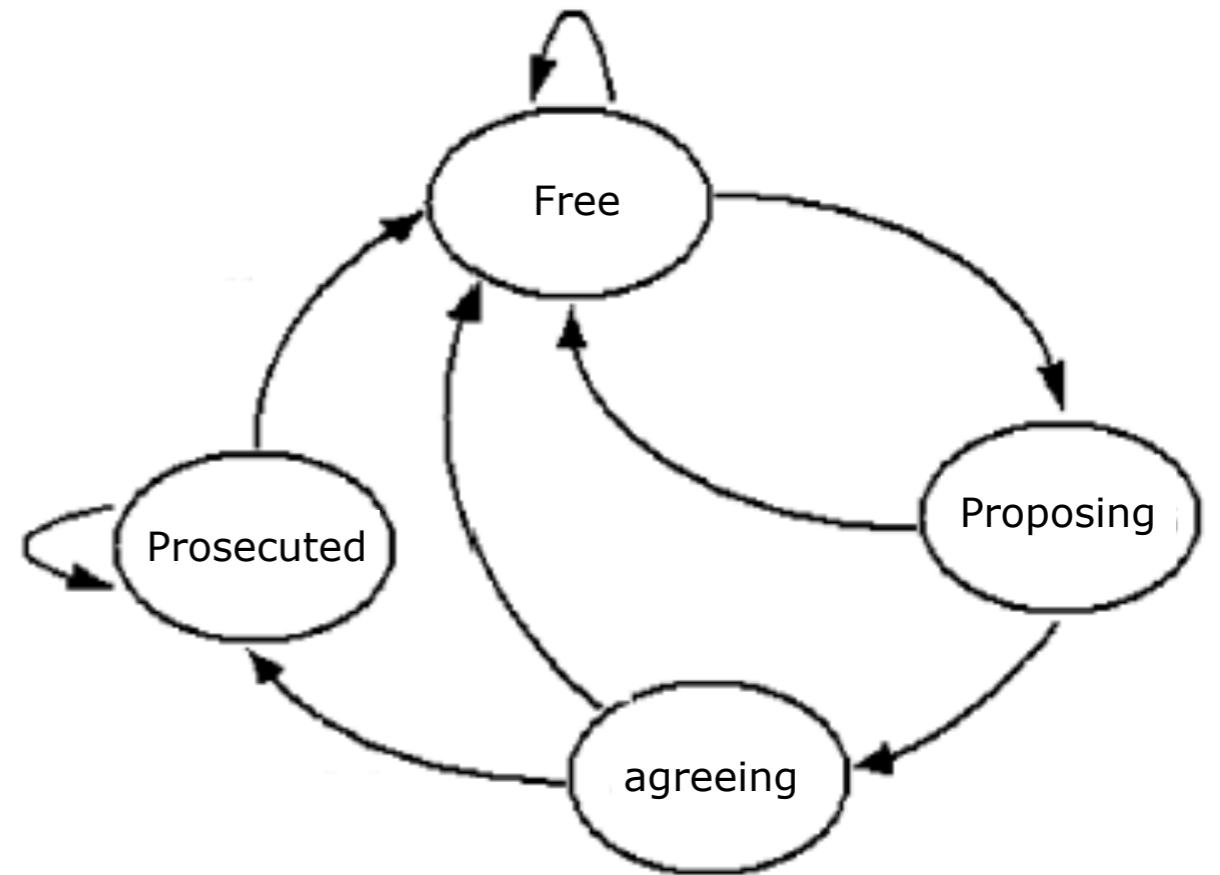

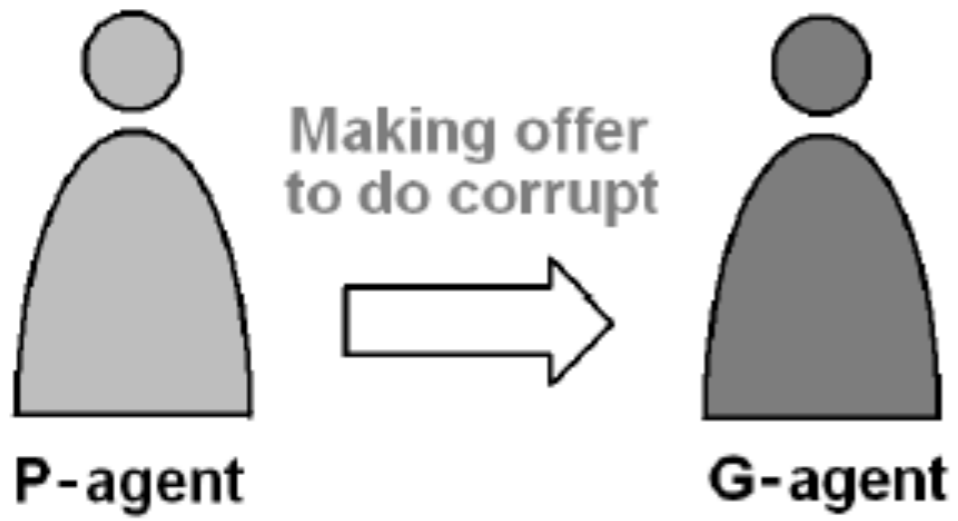

$p = 0$
➔
 $p = 1$
 Increasing randomness

$p = 0$
→
 $p = 1$
 Increasing randomness

Dynamics

Agent-based model

Payoffs

$$E = (1 - C)[F\alpha^* + (1 - F)\beta] + C(\beta - k\beta) \quad (1)$$

$$E > \beta \quad (2)$$

where:

E is the utility to evaluate

C: a subjective factor that represents the fear of being discovered

F: a subjective factor that indicates the confidence that the corrupt act succeed

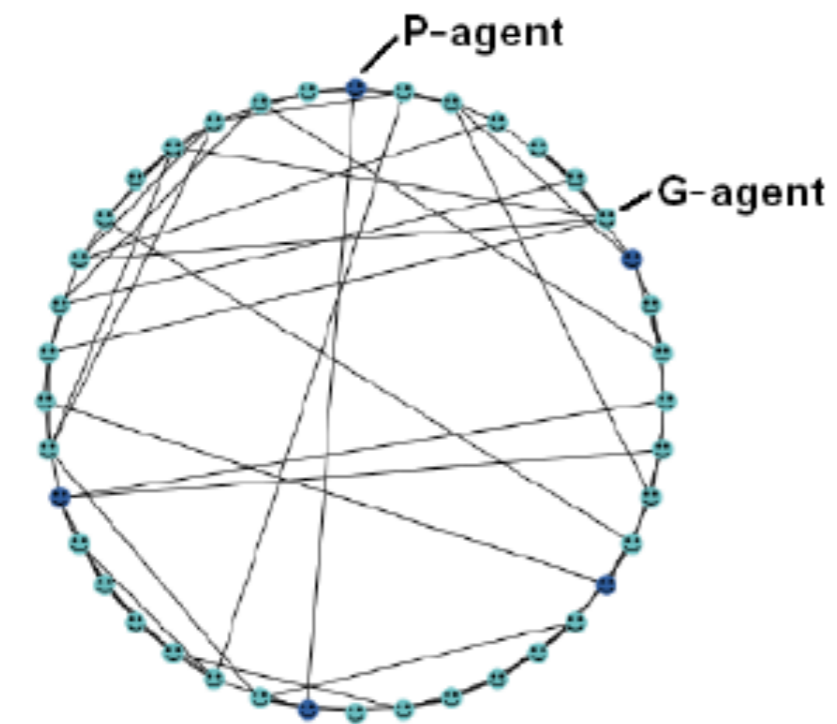

α is the profit (payoff) of corrupt behavior

α^* is the expectation of corruption and is calculated as $\alpha^* = (1 - i)\alpha$

i: honesty index, and is obtained from a Gaussian random distribution

k: sentence period applied to the corrupt agents who are captured. It is expressed in number of iterations

β is the profit (payoff) of honest behavior

Implications?

Lawmakers have not yet considered the consequences of [network structure].
Still understanding the way we are connected is an essential step in creating a more just society and in implementing public policies affecting everything from public health to the economy

N. Christakis and J. Fowler
Connected (2009), p. 31

No single model can account for all
corrupt behavior

All models are wrong but some are useful

George E. P. Box

Advantages

- Framework for studying **causal relationships**
- If A leads to B, at least one mechanism must exist
- Different mechanisms can be **classified into systematic categories** for influencing the level of corruption
- Consensus?

Advantages

- Framework for studying **causal relationships**
- If A leads to B, at least one mechanism must exist
- Different mechanisms can be **classified into systematic categories** for influencing the level of corruption
- Consensus?

Disadvantages

- Generation mechanisms are hypothetical. Real?
- **Need for validation (e.g., using statistics)**

Final remarks

1. Our lives are deeply intertwined with **complex networks (explain patterns)**
2. Potential of **data + networks**
3. Good network models can shape...
 - collection of data
 - questions being asked
 - design of official responses
 - close the gap between systemic thinkers and policy-makers
